

BUSINESS REQUIREMENTS DOCUMENT

Channel & Multi-Channel Management System

Document Type	Business Requirements Document (BRD)
Version	1.0
Prepared By	CodesGenesys Technology Pvt. Ltd.
Prepared For	Abdul Kadir — Garment Distribution Business
Date	March 2026
Status	Draft — Awaiting Client Sign-Off
Platforms	Web Application + Mobile Application (Android & iOS)

1. Executive Summary

This document captures the business requirements for a Channel & Multi-Channel Management System — a custom software platform designed to streamline your garment distribution operations. The system will manage inventory tracking, order dispatch, logistics receipt (LR) handling, payment confirmation, and business reporting across your godown and office — all accessible via a web browser and a mobile app on your phone.

This BRD describes what the business needs and why. It is the foundation for the technical team to build the right solution. Please review each section carefully and confirm that it accurately reflects your requirements before work begins.

2. Business Context & Problem Statement

2.1 Current Situation

Your business currently faces the following operational challenges:

- No centralised system to track stock across godown and office — leading to inaccurate inventory counts and manual reconciliation.
- Barcode scanning is either not in use or not connected to any live system, making real-time stock visibility impossible.
- Logistics receipts (LRs) are managed manually — sharing them with customers is slow, error-prone, and difficult to track.
- No proof of dispatch — if a customer claims wrong or missing items, there is no way to verify what was actually packed and sent.
- Payments are tracked informally, with no structured system to confirm receipt before processing orders.
- Business reporting (best-selling designs, ageing stock, customer history) requires manual effort and is rarely done in time to act on.

2.2 Business Objectives

The new system is being built to achieve the following business goals:

- Give you and your team real-time visibility of every item in stock — at any time, from any device.
- Automate the LR process — generate a shareable link and send it to the customer via SMS instantly on dispatch.
- Protect the business from false delivery claims by recording video evidence of every parcel being dispatched.
- Ensure payments are confirmed before orders are closed, reducing payment leakage.
- Give you actionable reports — top-selling designs, slow-moving stock, customer order history — so you can make smarter buying and selling decisions.

3. Stakeholders

Stakeholder	Role	Interest in the System
Business Owner / Client	Decision maker, final approver	Full visibility of operations, reports, stock, and payments
Godown Staff	Primary Mobile App users	Easy scanning, dispatch, LR upload via phone
Office Staff	Primary Web App users	Order management, payment confirmation, report access
Customers	Recipients of LR SMS	Receive LR link instantly after dispatch
CODES	Development team	Build and deliver the system as per this BRD

4. Project Scope

4.1 In Scope — Current Phase

Feature Area	What It Covers
Live Inventory Tracking	Real-time stock across godown & office via barcode scanning
Order & Dispatch Management	Full order lifecycle from receipt to dispatch confirmation
LR Management	Challan entry, LR photo/PDF upload, auto SMS link to customer
Payment Tracking	Payment screenshot upload and confirmation before order closure
CCTV Dispatch Verification	Video recording triggered at each dispatch, retrievable by order
Analytics & Reporting	Sales reports, inventory ageing, top designs, customer history
Web Application	Full-featured browser-based dashboard for office
Mobile Application	Android & iOS app for godown staff
SMS Notifications	LR link delivery, payment alerts via Authkey.io

4.2 Out of Scope — Deferred to Future Phase

Feature Area	Reason for Deferral
Billing System	GST invoice generation, piece-rate and fixed-amount billing — to be built in the next phase once current system is stable.

5. Business Requirements

BR-01: Live Inventory Visibility

The business needs to know exactly how much stock is available — by design, colour, and size — at any moment, both at the godown and office. Staff should not need to call each other or physically check to get stock counts.

Expected Outcome: Any team member with the app or web access can check live stock in seconds. Stock updates automatically when items are scanned in or out.

BR-02: Barcode Scanning

The business needs barcode scanning to work on an Android phone (for godown) and a computer scanner (for office). Scanning should update inventory instantly without any manual data entry.

Expected Outcome: Godown staff scan an item — stock count updates on the web dashboard in real time, visible to the office immediately.

BR-03: Order & Dispatch Management

The business receives orders from various channels. Godown staff need a simple way to see the order, pick the items (confirming via scan), and record the dispatch. The system should track the full lifecycle of every order.

Expected Outcome: Every order is tracked from receipt to dispatch. Nothing ships without being logged. Dispatch records include who picked it, when, and what was sent.

BR-04: Challan & LR Management — Upload and SMS Link

At the time of dispatch, staff enter the Challan Number and upload the LR document (as a photo from their phone or as a PDF). The system must then automatically generate a link to this LR and send it to the customer via SMS — so the customer can open and track their logistics receipt on their phone without calling the office.

Expected Outcome: Customer receives an SMS within seconds of dispatch with a link. They tap it and see their LR document — photo or PDF — directly on their screen. No calls needed. No WhatsApp forwards needed.

BR-05: Payment Confirmation

Orders must not be marked complete until payment is confirmed. Staff can upload a payment screenshot and confirm receipt. This prevents orders being closed before money arrives.

Expected Outcome: Payment status is visible on every order. Unpaid orders are flagged. Screenshots are stored against each order for future reference.

BR-06: CCTV Dispatch Verification

When a customer claims they received the wrong item or a missing piece, the business currently has no way to prove what was packed. The system must record a video clip every time an order is dispatched. This clip is automatically linked to the order and can be retrieved later as proof.

Expected Outcome: Any disputed order can be looked up in seconds and the exact dispatch footage is shown — proving what was packed and sent on what date and time.

BR-07: Analytics & Business Reports

The business owner needs regular reports without manual effort: which designs are selling the most, which stock has been sitting too long, which customers are buying regularly. These reports should be available in the system and exportable.

Expected Outcome: Top-selling designs report, inventory ageing report, and customer order history are available at any time. Reports can be downloaded as Excel or PDF.

6. System Flow Overview

The diagram below shows how all parts of the system work together — from order receipt at the godown to the customer receiving their LR link.

Figure 1: End-to-End System Flow — Channel Management System

7. Third-Party Infrastructure Costs

In addition to development costs, the following third-party services and hardware will be required. These are client-side costs not included in development fees.

Item	What It's For	Estimated Cost	Frequency
Hostinger KVM 2 VPS Server	Hosting the web system and database	₹799/mo (promo) → ₹1,199/mo	Monthly / Recurring
Authkey.io SMS (10,000 SMS pack)	Sending LR links and alerts to customers	₹3,186 per pack	As needed
CCTV Camera + NVR + HDD (2 stations)	Recording dispatch footage at godown	₹22,000 – ₹44,000	One-time
Cloud File Storage (Cloudflare R2)	Storing LR photos/PDFs and payment screenshots	~₹50–200/month	Monthly / Recurring
TOTAL RECURRING — Year 1		~₹13,000–17,000/year	Recurring
CCTV — One-time Hardware		₹22,000–44,000	One-time

8. Assumptions & Expectations

- All garment items will have barcodes on them before the system goes live.
- The CCTV cameras and NVR will be purchased and installed at the godown by the client before go-live.
- The client will register with Authkey.io for SMS and complete the mandatory TRAI DLT registration (required by Indian telecom regulations for commercial SMS).
- At least one Android smartphone will be available at the godown for use with the Mobile App.
- Stable internet will be available at the godown at all times.
- A designated person (admin) from the client's side will manage user accounts and system settings.
- Product master data — all designs, sizes, SKUs — will be provided to CodesGenesys for pre-loading before go-live.

9. Success Criteria

The project will be considered successfully delivered when:

#	Success Criterion
1	Godown staff can scan barcodes on the Mobile App and stock updates instantly on the Web App dashboard.
2	When an order is dispatched, staff can enter the challan number, upload the LR photo or PDF, and the customer receives an SMS with the LR link within 60 seconds.
3	Every dispatch triggers a CCTV recording that can be retrieved from the Web App by Order ID or Challan Number.
4	Office staff can view live inventory, confirm payments, and access all reports from the Web App without manual calculation.
5	Business owner can view the top-selling designs and inventory ageing report at any time from any device.
6	The system is live, trained staff can operate it independently, and all data is successfully migrated.

Additional Business Requirements:

BR-08: SKU Media & Dual Pricing

Each product SKU should support uploading multiple photos and videos so the sales team can show accurate product visuals. Each SKU must carry two prices — a Retail Price and a Wholesale Price — so the system can automatically apply the correct price based on order type without manual entry.

BR-09: Smart Order Creation

Orders should be creatable by scanning items directly. When creating an order, staff enter the customer's phone number — if the customer exists, their details load automatically. If not, they can create a new customer on the spot. Every order must be marked as either Retail or Wholesale at creation, which controls pricing and payment options throughout the order lifecycle.

BR-10: Customer Master with Full Trade Details

Customer records must capture full trade information: name, address, area, city, state, pincode, GST number, WhatsApp number, phone, email, broker name, transport preference, credit limit days, and remarks. This becomes the single source of truth for all dispatch, challan, and communication.

BR-11: Flexible Payment with Credit Control (Wholesale)

Wholesale orders must support partial payments — advance at booking, then installments over time with amount, remarks, and optional attachment per installment. The system must track the outstanding balance per customer and alert the admin when a customer's credit due date is approaching or overdue. A weekly reminder email must go to the accountant automatically.

BR-12: Daily Reconciliation

At end of day, the admin must be able to reconcile all collections — cash, UPI, and bank transfers — against total retail and wholesale orders. This reconciliation statement must be printable.

BR-13: CCTV Recording with Order ID Linking

When dispatching, a label with the Order ID is printed and placed on the parcel. The staff member enters or scans the Order ID in the CCTV module, the system auto-fetches the customer name, and the staff manually starts and stops the recording. The completed clip is then permanently linked to that Order ID.

BR-14: Challan Printing

The system must print a formatted challan for both retail and wholesale orders — including company header, party details, item-wise breakdown with pieces and rate, add/less adjustments, final amount, and terms and conditions with authorised signatory. Printable from both web and mobile.

BR-15: Print Module

The system must support printing of: SKU barcode labels, dispatch challans (retail & wholesale format), and daily collection statements — from both the web app and mobile app.

10. Approval & Sign-Off

By signing below, the client confirms that this BRD accurately represents the business requirements for the Channel & Multi-Channel Management System. Any changes post-sign-off will be handled through a formal change request process and may affect timeline and cost.
